

VERSION WITH MARKING TO SHOW CLAIM AMENDMENTS

1. (Twice Amended) A razor comprising a blade unit carrying structure on which a blade unit is permanently or detachably mounted for pivotal movement relative to the blade unit carrying structure about a predetermined pivot axis extending longitudinally through the blade unit, and a delivery system for conducting a fluid dispensed from a reservoir connected to the blade unit carrying structure to at least one discharge port, wherein the discharge port has an opening located at or close to the predetermined pivot axis for discharging the fluid to the blade unit at a guard surface at or near the predetermined pivot axis.

11. (Twice Amended) A razor comprising a blade unit carrying structure on one end of which a blade unit is permanently or detachably mounted for pivotal movement relative to the carrying structure about a predetermined pivot axis extending longitudinally through the blade unit, an opposite end of the blade unit carrying structure being hingedly connected to a supporting structure, a delivery system for conducting a fluid to the blade unit from a reservoir, the delivery system including a valve for controlling supply of fluid to the blade unit, the blade unit carrying structure being coupled to the valve for the valve to be actuated by displacement of the blade unit carrying structure relative to the supporting structure caused by pressing the blade unit against the skin during shaving, and the blade unit carrying structure being resiliently biased to close the valve when the blade unit is lifted clear of the skin, and wherein the blade unit carrying structure and the supporting structure are integrally connected by at least one flexible web which defines a second pivot axis about which the blade carrying structure is pivotable relative to the supporting structure.

VERSION WITH MARKING TO SHOW CLAIM AMENDMENTS

12. (Twice Amended) A razor blade unit carrying structure on one end of which a blade unit is permanently or detachably mounted for pivotal movement relative to the carrying structure about a predetermined pivot axis extending longitudinally through the blade unit, the carrying structure including a delivery duct for conducting a fluid supplied from a reservoir to the blade unit, an opposite end of the carrying structure being hingedly coupled to a supporting structure for a valve which is operable to control supply of fluid to the delivery duct from the reservoir to be actuated by displacement of the blade unit carrying structure relative to the supporting structure at the hinge coupling therebetween caused by pressing the blade unit against the skin during shaving, and wherein the blade unit carrying structure and the supporting structure are integrally connected by at least one flexible web which defines a second pivot axis about which the blade carrying structure is pivotable relative to the supporting structure.

22. (Twice Amended) A razor according to claim 11, wherein the blade unit carrying structure comprises a hollow stem structure extending from a flanged [flange-like] base, the base being engagable by a finger of a hand in which the razor is held for selectively displacing the blade unit carrying structure to actuate the valve.
